TITLE OF THE INVENTION

HYDROXYNAPHTHYRIDINONE CARBOXAMIDES USEFUL AS HIV

INTEGRASE INHIBITORS

5 This application claims the benefit of U.S. Provisional Application No. 60/349,775, filed January 17, 2002, the disclosure of which is hereby incorporated by reference in its entirety.

FIELD OF THE INVENTION

10 The present invention is directed to 4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamides and pharmaceutically acceptable salts thereof, their synthesis, and their use as inhibitors of the HIV integrase enzyme. The compounds of the present invention and their pharmaceutically acceptable salts are useful for preventing or treating infection by HIV and for treating, delaying the onset of, or
15 preventing AIDS.

BACKGROUND OF THE INVENTION

 A retrovirus designated human immunodeficiency virus (HIV) is the etiological agent of the complex disease that includes progressive destruction
20 of the immune system (acquired immune deficiency syndrome; AIDS) and degeneration of the central and peripheral nervous system. This virus was previously known as LAV, HTLV-III, or ARV. A common feature of retrovirus replication is the insertion by virally-encoded integrase of proviral DNA into the host cell genome, a required step in HIV replication in human T-lymphoid and
25 monocytoïd cells. Integration is believed to be mediated by integrase in three steps: assembly of a stable nucleoprotein complex with viral DNA sequences; cleavage of two nucleotides from the 3' termini of the linear proviral DNA; covalent joining of the recessed 3' OH termini of the proviral DNA at a staggered cut made at the host target site. The fourth step in the process, repair synthesis of
30 the resultant gap, may be accomplished by cellular enzymes.

 Nucleotide sequencing of HIV shows the presence of a pol gene in one open reading frame [Ratner et al., *Nature* 1985, 313: 277]. Amino acid sequence homology provides evidence that the pol sequence encodes reverse transcriptase, integrase and an HIV protease [Toh et al., *EMBO J.* 1985, 4: 1267;

Power et al., *Science* 1986, 231: 1567; Pearl et al., *Nature* 1987, 329: 351]. All three enzymes have been shown to be essential for the replication of HIV.

It is known that some antiviral compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS and similar diseases, including reverse transcriptase inhibitors such as azidothymidine (AZT) and efavirenz and protease inhibitors such as indinavir and nelfinavir. The compounds of this invention are inhibitors of HIV integrase and inhibitors of HIV replication. The inhibition of integrase in vitro and of HIV replication in cells is a direct result of inhibiting the strand transfer reaction catalyzed by the recombinant integrase in vitro in HIV infected cells. The particular advantage of the present invention is highly specific inhibition of HIV integrase and HIV replication.

"C₁₋₄ alkyl" means n-, iso-, sec- and t-butyl, n- and
35 isopropyl, ethyl and methyl.

The term "-C₁₋₆ alkyl-" refers to a C₁ to C₆ linear or branched alkyl group as just defined which is bivalent. It can alternatively be referred to as "C₁₋₆ alkylene" or "C₁₋₆ alkanediyl". A class of alkylenes of particular interest with respect to the invention is -(CH₂)₁₋₆-, and sub-classes of particular interest include

5 -(CH₂)₁₋₄-, -(CH₂)₁₋₃-, -(CH₂)₁₋₂-, and -CH₂-.

The term "C₀" as employed in expressions such as "C₀₋₆ alkyl" means a direct covalent bond. For example, when L in Compound I is -(C₀₋₃ alkyl)-C=C-(C₁₋₃ alkyl)-, then L is -C=C-(C₁₋₃ alkyl)-, when the first alkyl group is "C₀". As a further, more specific example, when L is -(C₀₋₃ alkyl)-C=C-(C₁₋₃ alkyl)-, wherein the first alkyl group is "C₀" and the second alkyl group is "C₁", then
10 the compound is a compound of Formula (III):

The term "C₂₋₆ alkenyl" (or "C₂₋₆ alkenyl") means linear or
15 branched chain alkenyl groups having from 2 to 6 carbon atoms and includes all of the hexenyl and pentenyl isomers as well as 1-butenyl, 2-butenyl, 3-butenyl, isobutenyl, 1-propenyl, 2-propenyl, and ethenyl (or vinyl). Similar terms such as "C₂₋₄ alkenyl" have an analogous meaning.

The term "C₂₋₅ alkynyl" (or "C₂₋₅ alkynyl") means linear or
20 branched chain alkynyl groups having from 2 to 5 carbon atoms and includes all of the pentynyl isomers as well as 1-butylnyl, 2-butylnyl, 3-butylnyl, 1-propynyl, 2-propynyl, and ethynyl (or acetylenyl). Similar terms such as "C₂₋₄ alkynyl" have an analogous meaning.

The term "C₃₋₈ cycloalkyl" (or "C₃₋₈ cycloalkyl") means a cyclic
25 ring of an alkane having three to eight total carbon atoms (i.e., cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, or cyclooctyl). Similar terms such as "C₃₋₆ cycloalkyl" have an analogous meaning.

The term "halogen" (or "halo") refers to fluorine, chlorine, bromine and iodine (alternatively referred to as fluoro, chloro, bromo, and iodo).

The term "C₁₋₆ haloalkyl" (which may alternatively be referred to as "C₁-C₆ haloalkyl" or "halogenated C₁-C₆ alkyl") means a C₁ to C₆ linear or branched alkyl group as defined above with one or more halogen substituents. The term "C₁₋₄ haloalkyl" has an analogous meaning. The term "C₁₋₆ fluoroalkyl" has an analogous meaning except that the halogen substituents are restricted to fluoro. Suitable fluoroalkyls include the series (CH₂)₀₋₄CF₃ (i.e., trifluoromethyl, 2,2,2-trifluoroethyl, 3,3,3-trifluoro-n-propyl, etc.).

The term "carbocycle" (and variations thereof such as "carbocyclic" or "carbocyclyl") as used herein refers to (i) a C₃ to C₈ monocyclic, saturated or unsaturated ring, (ii) a C₇ to C₁₂ bicyclic ring system, or (iii) a C₁₁ to C₁₆ tricyclic ring system, wherein each ring in (ii) or (iii) is independent of or fused to the other ring or rings and each ring is saturated or unsaturated. The carbocycle may be attached to the rest of the molecule at any carbon atom which results in a stable compound. When the carbocyclic ring has substituents, it is understood that the substituents may be attached to any atom in the ring which results in a stable chemical structure.

The fused bicyclic carbocycles are a subset of the carbocycles; i.e., the term "fused bicyclic carbocycle" generally refers to a C₇ to C₁₂ bicyclic ring system in which each ring is saturated or unsaturated and two adjacent carbon atoms are shared by each of the rings in the ring system. Fused tricyclic carbocycles have an analogous meaning. A subset of the fused bicyclic carbocycles are those bicyclic carbocycles in which one ring is a benzene ring and the other ring is saturated or unsaturated, with attachment via any carbon atom that results in a stable compound. Representative examples of this subset include the following:

Aryl groups form a subset of the carbocycles; i.e., the term "aryl" as used herein refers to an aromatic carbocyclic ring or an aromatic carbocyclic fused

ring system. The fused ring system contains two or more carbocyclic rings in which each ring shares two adjacent carbon atoms with at least one other ring. The aryl group may be attached to the rest of the molecule at any carbon atom which results in a stable compound.

5 A subset of aryl groups particularly suitable for use in the present invention (e.g., in the definition of R^{2a} or R^{2b}, when R^{2a} or R^{2b} is -C₁₋₆ alkyl substituted with aryl) includes those selected from phenyl, naphthyl, anthryl, and phenanthryl. Another particularly suitable subset of aryl groups is phenyl and naphthyl. Still another particularly suitable subset of aryl groups is phenyl per se.

10 A subset of carbocycles particularly suitable for use in the present invention (e.g., in the definition of R^k or R^m) includes any carbocycle which is (i) -C₃₋₈ cycloalkyl or (ii) aryl. Another particularly suitable subset includes any carbocycle which is -C₃₋₈ cycloalkyl, phenyl, naphthyl, anthryl, or phenanthryl. Still another particularly suitable subset includes any carbocycle which is -C₃₋₈ cycloalkyl,
15 phenyl, or naphthyl. Yet another particularly suitable subset is phenyl and naphthyl, and still another is phenyl per se.

 The term "heterocycle" (and variations thereof such as "heterocyclic" or "heterocyclyl") refers to (i) a 4- to 8-membered, saturated or unsaturated monocyclic ring, (ii) a 7- to 12-membered bicyclic ring system, or (iii) an 11 to 16-
20 membered tricyclic ring system; wherein each ring in (ii) or (iii) is independent of or fused to the other ring or rings and each ring is saturated or unsaturated, and the monocyclic ring, bicyclic ring system, or tricyclic ring system contains one or more heteroatoms (e.g., from 1 to 6 heteroatoms, from 1 to 5 heteroatoms, or from 1 to 4 heteroatoms) independently selected from N, O and S and a balance of carbon atoms
25 (the monocyclic ring typically contains at least one carbon atom and the ring systems typically contain at least two carbon atoms); and wherein any one or more of the nitrogen and sulfur heteroatoms is optionally oxidized, and any one or more of the nitrogen heteroatoms is optionally quaternized. The heterocyclic ring may be attached to the rest of the molecule via any heteroatom or carbon atom in the ring, provided
30 that attachment results in the creation of a stable structure. When the heterocyclic ring has substituents, it is understood that the substituents may be attached to any atom in the ring, whether a heteroatom or a carbon atom, provided that a stable chemical structure results.

 Saturated heterocyclics form a subset of the heterocycles; i.e., the term
35 "saturated heterocyclic" generally refers to a heterocycle as defined above in which

the entire ring system (whether mono- or poly-cyclic) is saturated. The term "saturated heterocyclic ring" refers to a 4- to 7-membered saturated monocyclic ring which consists of carbon atoms and one or more heteroatoms independently selected from N, O and S. The term "heteroaromatic ring" refers a 5- or 6-membered monocyclic aromatic ring which consists of carbon atoms and one or more (e.g., from 1 to 4) heteroatoms independently selected from N, O and S. Representative examples of heteroaromatic rings include pyridyl, pyrrolyl, pyrazinyl, pyrimidinyl, pyridazinyl, thienyl (or thiophenyl), thiazolyl, furanyl, imidazolyl, pyrazolyl, triazolyl, tetrazolyl, oxazolyl, isooxazolyl, oxadiazolyl, thiazolyl, isothiazolyl, and thiadiazolyl.

Representative examples of tricyclic heterocycles include phenothiazinyl, carbazolyl, beta-carbolinyl, tetrahydro-beta-carbolinyl, acridinyl, phenazinyl, and phenoxazinyl.

A subset of heterocycles particularly suitable for use in the present invention (e.g., in the definition of R^k or R^m) includes any heterocycle which is (i) a 4- to 7-membered saturated heterocyclic ring containing from 1 to 4 heteratoms selected from N, O and S, or (ii) a 5- or 6-membered heteroaromatic ring containing from 1 to 4 heteroatoms independently selected from N, O and S. Another particularly suitable subset includes any heterocycle which is (i) a 5 or 6-membered

saturated heterocyclic ring containing from 1 to 4 heteratoms independently selected from N, O and S, or (ii) a 5- or 6-membered heteroaromatic ring containing from 1 to 4 heteratoms independently selected from N, O and S. Still another particularly suitable subset includes any heterocycle which is (i) a 5 or 6-membered saturated heterocyclic ring containing from 1 to 3 heteratoms independently selected from N, O and S, or (ii) a 5- or 6-membered heteroaromatic ring containing from 1 to 4 heteratoms independently selected from N, O and S. Still another particularly suitable subset includes any heterocycle which is (i) a 5 or 6-membered saturated heterocyclic ring containing from 1 or 2 heteratoms independently selected from N, O and S, or (ii) a 5- or 6-membered heteroaromatic ring containing from 1 to 4 N atoms.

A subset of heteroaryl groups particularly suitable for use in the present invention (e.g., in the definition of R^{2a} or R^{2b}, when R^{2a} or R^{2b} is -C₁₋₆ alkyl substituted with heteroaryl) includes any heteroaryl which is a 5- or 6-membered heteroaromatic ring containing from 1 to 4 heteratoms or a 9- or 10-membered bicyclic heteroaromatic ring system containing from 1 to 6 heteratoms, wherein the heteratoms in the heteroaryl are independently selected from N, O and S. Another particularly suitable subset of aryl groups includes any heteroaryl which is a 5- or 6-membered heteroaromatic ring containing from 1 to 4 heteratoms. Still another particularly suitable subset of heteroaryl groups includes any heteroaryl which is pyridyl, pyrrolyl, pyrazinyl, pyrimidinyl, pyridazinyl, thienyl, furanyl, imidazolyl, pyrazolyl, triazolyl, tetrazolyl, oxazolyl, isooxazolyl, oxadiazolyl, thiazolyl, isothiazolyl, or thiadiazolyl.

Unless expressly stated to the contrary, an "unsaturated" ring is a partially or fully unsaturated ring. For example, an "unsaturated monocyclic C₆ carbocycle" refers to cyclohexene, cyclohexadiene, and benzene.

Unless expressly stated to the contrary, all ranges cited herein are inclusive. For example, a heterocycle described as containing from "1 to 4 heteratoms" means the heterocycle can contain 1, 2, 3 or 4 heteratoms.

When any variable (e.g., R^a, R^b, or R^m) occurs more than one time in any constituent or in Formula I or in any other formula depicting and describing compounds of the invention, its definition on each occurrence is independent of its definition at every other occurrence. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

The term "substituted" (e.g., as in "aryl which is optionally substituted with one or more substituents ...") includes mono- and poly-substitution by a named

substituent to the extent such single and multiple substitution (including multiple substitution at the same site) is chemically allowed.

The compounds of the present invention may have asymmetric centers and may occur, except when specifically noted, as mixtures of stereoisomers or as individual diastereomers, or enantiomers, with all isomeric forms being included in the present invention.

Compounds of Formula I wherein $R^3 = H$ may also occur as tautomers thereof. Tautomers include, but are not limited to:

10

It is understood that the present invention includes all tautomers of the hydroxynaphthyridinone compounds embraced by Formula I, both singly and in mixtures.

The compounds of the present invention are useful in the inhibition of HIV integrase, the prevention or treatment of infection by human immunodeficiency virus (HIV) and the prevention, treatment or the delay in the onset of consequent pathological conditions such as AIDS. Preventing AIDS, treating AIDS, delaying the onset of AIDS, or preventing or treating infection by HIV is defined as including, but not limited to, treatment of a wide range of states of HIV infection: AIDS, ARC (AIDS related complex), both symptomatic and asymptomatic, and actual or potential exposure to HIV. For example, the compounds of this invention are useful in treating infection by HIV after suspected past exposure to HIV by such means as blood

15

20

transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery.

The compounds of this invention are useful in the preparation and execution of screening assays for antiviral compounds. For example, the compounds of this invention are useful for isolating enzyme mutants, which are excellent screening tools for more powerful antiviral compounds. Furthermore, the compounds of this invention are useful in establishing or determining the binding site of other antivirals to HIV integrase, e.g., by competitive inhibition. Thus the compounds of this invention are commercial products to be sold for these purposes.

The compounds of the present invention can be administered in the form of pharmaceutically acceptable salts. The term "pharmaceutically acceptable salt" refers to a salt which possesses the effectiveness of the parent compound and which is not biologically or otherwise undesirable (e.g., is neither toxic nor otherwise deleterious to the recipient thereof). Suitable salts include acid addition salts which may, for example, be formed by mixing a solution of the compound of the present invention with a solution of a pharmaceutically acceptable acid such as hydrochloric acid, sulfuric acid, acetic acid, trifluoroacetic acid, or benzoic acid. When the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof can include alkali metal salts (e.g., sodium or potassium salts), alkaline earth metal salts (e.g., calcium or magnesium salts), and salts formed with suitable organic ligands such as quaternary ammonium salts. Also, in the case of an acid (-COOH) or alcohol group being present, pharmaceutically acceptable esters can be employed to modify the solubility or hydrolysis characteristics of the compound.

For the purpose of preventing or treating HIV infection or preventing, treating or delaying the onset of AIDS, the compounds of the present invention can be administered orally, parenterally (including subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques), by inhalation spray, or rectally, in the form of a unit dosage of a pharmaceutical composition containing a therapeutically effective amount of the compound and conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles.

The term "administration" and variants thereof (e.g., "administering" a compound) in reference to a compound of the invention mean providing the compound to the individual in need of treatment. When a compound of the invention is provided in combination with one or more other active agents (e.g., antiviral agents useful for treating HIV infection or AIDS), "administration" and its variants are each

understood to include concurrent and sequential provision of the compound and other agents.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combining the specified ingredients in the specified amounts.

By "pharmaceutically acceptable" is meant that the ingredients of the pharmaceutical composition must be compatible with each other and not deleterious to the recipient thereof.

The term "subject" (which may be alternatively referred to herein as "patient") as used herein refers to an animal, preferably a mammal, most preferably a human, who has been the object of treatment, observation or experiment.

The term "therapeutically effective amount" as used herein means that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue, system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease being treated. When the active compound (i.e., active ingredient) is administered as the salt, references to the amount of active ingredient are to the free acid or free base form of the compound.

The pharmaceutical compositions can be in the form of orally-administrable suspensions or tablets or capsules, nasal sprays, sterile injectible preparations, for example, as sterile injectible aqueous or oleagenous suspensions or suppositories. These compositions can be prepared by methods and contain excipients which are well known in the art. Suitable methods and ingredients are described in Remington's Pharmaceutical Sciences, 18th edition, edited by A. R. Gennaro, Mack Publishing Co., 1990, which is herein incorporated by reference in its entirety.

The compounds of this invention can be administered orally in a dosage range of 0.001 to 1000 mg/kg of mammal (e.g., human) body weight per day in a single dose or in divided doses. One preferred dosage range is 0.01 to 500 mg/kg body weight per day orally in a single dose or in divided doses. Another preferred dosage range is 0.1 to 100 mg/kg body weight per day orally in single or divided doses. For oral administration, the compositions can be provided in the form of tablets or capsules containing 1.0 to 500 milligrams of the active ingredient, particularly 1, 5, 10, 15, 20, 25, 50, 75, 100, 150, 200, 250, 300, 400, and 500

milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

As noted above, the present invention is also directed to use of the HIV integrase inhibitor compounds of the present invention with one or more agents useful in the treatment of HIV infection or AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of one or more of the HIV/AIDS antivirals, immunomodulators, antiinfectives, or vaccines useful for treating HIV infection or AIDS. Suitable agents include those listed in the following Table:

30 The compounds of the present invention can be readily prepared according to the following reaction schemes and examples, or modifications thereof, using readily available starting materials, reagents and conventional synthesis procedures. In these reactions, it is also possible to make use of variants which are themselves known to those of ordinary skill in this art, but are not mentioned in greater detail. Furthermore, other methods for preparing compounds of the invention
35 will be readily apparent to the person of ordinary skill in the art in light of the

following reaction schemes and examples. Unless otherwise indicated, all variables are as defined above.

The compounds of the present invention can be prepared by the coupling of suitable 1,5-naphthyridine-3-carboxylic acids (or acid derivatives such as acid halides or esters) with the appropriate amines, as represented by the following general scheme:

SCHEME 1

10

Methods for coupling carboxylic acids (and acid derivatives) with amines to form carboxamides are well known in the art. Suitable methods are described, for example, in Jerry March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, pp. 370-376. Amines of formula 1-1 can be prepared using, for example, the methods described in Richard Larock, Comprehensive Organic Transformations, VCH Publishers Inc, 1989, pp 385-438, or routine variations thereof. Schemes 2 to 4 below illustrate and expand upon the chemistry portrayed in Scheme 1.

15

Compounds of Formula 1-2 in which $R^3 = H$ can be prepared in accordance with Scheme 2, wherein 3-amino-2-carboxy pyridine 2-1 (which can be prepared in accordance with Sucharda, *Chem. Ber.* 1925, 1727) can be esterified in acid and an alcohol to give the aminoester 2-2 in the form of a salt. Such methods are well known in the art and are described, for example, in J. March, *Advanced Organic Chemistry*, 3rd edition, John Wiley & Sons, 1985, pp. 348-351, in Madrigal et al., *Tetrahedron: Asymmetry* 2000, **11**: 3515-352, 2000, and in Culbertson et al., *J. Am. Chem. Soc.* 2000, **122**: 4032-4038. The ester can be obtained as the free base through neutralization by chromatography or by an aqueous workup, after which aminoester 2-2 can be reacted with an appropriate base and methyl-3-chloro-3-oxo propionate to give the acylated amine 2-3. A similar type of acylation is described in *J. Org. Chem.* 1996, **61**: 1872-1874. Alternatively, aminoester 2-2 can be treated with a dialkylmalonate at elevated temperature to accomplish the acylation (see, e.g., *Chem. Pharm. Bull.* 1993, **41**: 1163-1165). When excess base is present, the acylated intermediate can undergo Dieckmann cyclization to give the 1,5-naphthyridin-2-one-3-carboxylate ester 2-4 (see *J. Heterocyclic Chem.* 1998, **35**: 627-636 and *J. Heterocyclic Chem.* 1993, **30**: 909-912). The ester 2-4 can then be heated in an alcohol in the presence of an appropriate amine to give the 3-amide. (See *The Chemistry of Amides*, edited by S. Patai, Wiley Interscience, 1970, p. 96).

SCHEME 2

Compounds of Formula 1-2 in which R³ is other than H can be prepared in accordance with Scheme 3, wherein 3-fluoro-2-cyanopyridine 3-1 (which can be prepared in accordance with Sakamoto et al., *Chem. Pharm. Bull.* 1985, 33: 565-571) can be combined with an appropriately derivatized amine 3-2 in a suitable solvent (e.g., DMSO) and heated in the presence of base (e.g., a trialkylamine such as DIPEA). The resulting 2-cyano derivative 3-3 can then be treated with an alcohol, HCl and water under Pinner conditions to give aminoester 3-4 as a salt. A discussion of the Pinner reaction can be found in The Chemistry of the Cyano Group, edited by S.Patai, Wiley-Interscience, 1970, p. 264. Because protonation of the aminocyanopyridine can decrease the reactivity of the cyano group, a large excess of HCl and prolonged reaction time under pressure is typically required in order to make the intermediate imidate. Refluxing the imidate with water will afford the aminoester. After an aqueous workup to obtain the aminoester in free base form, the aminoester can be treated with an appropriate base (e.g., an alkali metal alkoxide such as NaOMe) and methyl-3-chloro-3-oxo propionate to give, after cyclization, the 1,5-naphthyridin-2-one-3-carboxylate ester 3-6 (see, e.g., *J. Heterocyclic Chem.* 1998, 35: 627-636 and *J. Heterocyclic Chem.* 1993, 30: 909-912), which can then be heated in an alcohol in the presence of an appropriate amine to give the 3-amide.

20 SCHEME 3

Scheme 4 illustrates a variation in the coupling reaction set forth in Scheme 1 for the case in which one of R^{2a} and R^{2b} in amine 1-1 is alkylsulfonyl. In the scheme, amine reactant 4-1 containing an *o*-alkylthio substituent on its phenyl ring is coupled to the 1,5-naphthyridin-2-one-3-carboxylate ester 4-2 to provide amide 4-3, which is oxidized to the final product 4-4 using *m*-CPBA or another oxidant known in the art, such as those described in J. March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, p. 1089. The alkylthio-containing amine reactant 4-1 can be prepared by methods known in the art, including via the formation of aryl anions using the metal-halogen exchange reaction of aryl halogens with strong lithium bases. This chemistry is described, for example, in B. Wakefield, Chemistry of Organolithium Compounds, Pergamon Press, Oxford, 1974. As an example of the application of this approach, 4-fluoro-2-methylthio-benzylamine can be prepared by the metal halogen exchange of 2-bromo-4-fluorobenzoic acid by first deprotonating the acid with Grignard reagent, then conducting the metal-bromine exchange with a strong base like *n*-butyllithium, and then trapping with dimethyldisulfide (see, e.g., *Synthetic Methods* 1993, 56(1): 2128) to obtain 2-methylthio-4-fluorobenzoic acid. The benzoic acid can then be converted to the primary amide using standard coupling conditions (see M. Bodansky, The Practice of Peptide Synthesis, Springer-Verlag,

New York, 1984) and the amide reduced to the benzyl amine using a strong reducing agent, such as those described in J. March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, p. 815). The resulting 4-fluoro-2-methylthiobenzylamine can then be coupled and oxidized into the desired naphthyridine product in the manner set forth in Scheme 4.

SCHEME 4

The methyl sulfone can alternatively be incorporated into the benzyl amine before the coupling step. The appropriate 4-fluoro-2-methylsulfonyl benzylamine can be prepared in a 3-step process, in which 2,4-difluorobenzonitrile is first treated with thiomethoxide in the presence of an aprotic solvent such as toluene. Similar displacements are discussed in J. March, Advanced Organic Chemistry, 3rd

edition, John Wiley & Sons, 1985, p. 589. The resulting 2-methylsulfide can then be oxidized to the sulfone as discussed above, followed by reduction of the cyano group with hydrogen and palladium catalysis in the presence of acid to afford the benzylamine. Such reductions are described in J. March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, p. 815.

Scheme 5 illustrates a variation in the preparation of 5-N-substituted compounds. In the scheme, the acylated intermediate **3-5** is treated with a base such as sodium methoxide and the resulting bis-sodium salt **5-1** is isolated. This salt, which is very water soluble, is then treated under phase transfer conditions with a suitable alkyl halide to give the bis-alkylated product **5-2**. Similar reactions are described by J. March, Advanced Organic Chemistry, 4th edition, J. Wiley & Sons, 1992, p.362-365. The 7-ester is then hydrolyzed with NaOH to give the acid **5-3**. Coupling conditions as described in Scheme 1 then give the 7-amide **5-4**, and the 8-O-alkyl group is then removed with strong acid such as trifluoroacetic acid (TFA) to give the final product **5-5**. General methods for similar cleavage of phenolic alkyl groups are described in T. W. Greene, Protective Groups in Organic Synthesis, 3rd edition, John Wiley & Sons, 1999, p. 246-292.

SCHEME 5

In the processes for preparing compounds and intermediates of the present invention set forth in the foregoing schemes, functional groups in various moieties and substituents may be sensitive or reactive under the reaction conditions employed and/or in the presence of the reagents employed. Such sensitivity/reactivity can interfere with the progress of the desired reaction to reduce the yield of the desired product, or possibly even preclude its formation. Accordingly, it may be necessary or desirable to protect sensitive or reactive groups on any of the molecules concerned. Protection can be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973 and in T.W. Greene & P.G.M. Wuts, Protective Groups in Organic Synthesis, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known in the art. Alternatively the interfering group can be introduced into the molecule subsequent to the reaction step of concern. For example, if one or more of the substituents R^{1a-c}, R^{2a-b}, R³, R⁴ and R⁵ in compound 1-1 can interfere with the coupling reaction between compounds 1-1 and 1-2 of Scheme 1, the substituent can be incorporated into the molecule in a post-coupling step to afford Compound I.

The following examples serve only to illustrate the invention and its practice. The examples are not to be construed as limitations on the scope or spirit of the invention.

EXAMPLE 1

N-(4-fluorobenzyl)-4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamide

Step 1: Preparation of methyl 3-aminopyridine-2-carboxylate

5

Methanol (75 mL) was cooled to 0°C and treated dropwise with thionylchloride (3.5 mL, 48 mmol). 3-aminopyridine-2-carboxylic acid (0.9 g, 6.52 mmol, prepared as described by Sucharda, *Chem. Ber.* 1925, 1727) was added and the mixture brought to reflux. Over the next two days, two more MeOH/thionyl chloride mixtures were made and added to the reaction. The reaction was evaporated to dryness, then treated with thionyl chloride (5.7 mL, 78.3 mmole) in 75 mL of MeOH and refluxed for two more days. The reaction was evaporated to dryness and chromatographed on silica eluting with 9:1:1 EtOH/NH₄OH/H₂O to give methyl 3-aminopyridine-2-carboxylate as a yellow solid.

15 ¹NMR (DMSO-d₆, 400 MHz) δ 7.84 (1H, dd, *J* = 1.3, 4 Hz), 7.28 (1H, dd, *J* = 4.0, 8.4 Hz), 7.21 (1H, dd, *J* = 1.5, 8.4 Hz), 6.67 (1H, bs), 3.80 (3H, s) ppm.

MS calc'd for C₇H₈N₂O₂ 152(M), found 153 (MH⁺).

20 The compound was also alternatively prepared as follows:

Step 1a': Preparation of 3-aminopyridine-2-carbonitrile.

A solution of 3-fluoro-2-cyanopyridine (Sakamoto et.al., *Chem. Pharm. Bull.* 1985, 33: 565-571) (10g, 82 mmol) in DMSO (30 mL) was placed in a pressure vessel and saturated with ammonia gas. The reaction was capped and heated to 70 degrees C overnight. The reaction was cooled, vented and re-saturated with ammonia, then sealed and re-heated for several hours. The reaction was cooled, vented, diluted with CHCl₃ and the solids that had formed were filtered off. The solution was added to the top of a silica gel column (150 mm x 7 inches) saturated with CHCl₃ and the column was eluted with a gradient of 100% CHCl₃ to 100% CHCl₃ saturated with NH₃. The fractions were collected and concentrated to give the product which contained some residual DMSO. This was used a in the next step.

¹NMR (CDCl₃, 400 MHz) δ 7.83 (1H, dt, *J* = 1.37, 4.2 Hz), 7.28 (1H, dd, *J* = 4.3, 8.6 Hz), 7.18 (1H, dt, *J* = 1.37, 8.6 Hz), 6.22 (2H, bs) ppm.

Step 1b': Preparation of methyl 3-aminopyridine-2-carboxylate

A solution of 3-aminopyridine-2-carbonitrile (9.7g, 81.8 mmol) in MeOH (100 mL) was placed in a round bottom pressure vessel. The solution was cooled to -78 °C and HCl gas was bubbled through the solution until the volume of the solution had noticeably increased. The flask was sealed and the reaction warmed to room temperature and stirred overnight. At this time, LCMS (sampled after re-cooling the reaction to -78 °C) showed only a small amount of starting cyano compound remaining. Water (14 mL, 818 mmol) was added and the reaction transferred to a flask equipped with a reflux condenser. The reaction was refluxed overnight. The solution was concentrated and the remaining solution was basified with 1N NaOH to pH 9, then extracted with CHCl₃ repeatedly until very little UV-

active material was removed. The organic layers were dried over Na₂SO₄, filtered and evaporated to give the product as a pink solid.

¹NMR (CDCl₃, 400 MHz) δ 8.06 (1H, dd, *J* = 1.46, 4.2 Hz), 7.21 (1H, dd, *J* = 4.2, 8.5 Hz), 7.04 (1H, dd, *J* = 1.46, 8.4 Hz), 5.8 (2H, bs), 3.97 (3H, s) ppm.

5 MS calc'd for C₇H₈N₂O₂ 152(M), found 153 (MH⁺)

Step 2: Preparation of methyl 3-[(3-methoxy-3-oxopropanoyl)amino]pyridine-2-carboxylate

10 A solution of methyl 3-aminopyridine-2-carboxylate (0.25g, 1.6 mmol) in pyridine (3 mL) was cooled to 0°C and treated with Hunig's base (DIPEA, 0.86 mL, 4.9 mmol) and methyl 3-chloro-3-oxopropionate (0.18 mL, 1.6 mmol). The reaction was allowed to warm to room temperature. Over the next several hours, 3 more equivalents of the acid chloride was added. The reaction was evaporated and re-

15 dissolved in CHCl₃, washed with NH₄Cl and evaporated to give an oil that was purified on silica with a gradient of 80-95% EtOAc/Hexanes to give the product as a white oil. The oil was a mixture of mono- and bis-acylated products that was taken on to the next reaction.

20 Alternatively, methyl 3-aminopyridine-2-carboxylate (0.565g, 3.4 mmol) was combined with dimethylmalonate (5g, 37.4 mmol) and heated to 125 °C in a sealed tube. The reaction was stirred for 3 days. The volatiles were removed in vacuo and the crude material was taken on to the next step.

R_f (silica, 20% Hexanes/EtOAc) = 0.46 (blue under UV light).

25 Step 3: Preparation of methyl 4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate

Sodium methoxide (0.73g, 13.5 mmol) was added to 2 methyl 3-[(3-methoxy-3-oxopropanoyl)amino]pyridine-2-carboxylate (0.9g, 3.4 mmol) dissolved in THF (20 mL). The reaction was stirred overnight. Water was added and the solvents removed. The residue was dissolved in water and purified by reverse phase HPLC eluting with a gradient of 5-40% acetonitrile/water (0.1% TFA) to give the product as a yellow solid.

^1H NMR (DMSO- d_6 , 400MHz) δ 11.7 (1H, bs), 8.53 (1H, d, $J = 4.2$ Hz), 7.70 (1H, d, $J = 8.4$ Hz), 7.65 (1H, dd, $J = 4.2, 8.2$ Hz), 3.77 (3H, s) ppm.

Step 4. Preparation of N-(4-fluorobenzyl)-4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamide.

A mixture of methyl 4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate (0.2g, 0.91 mmol) and 4-fluorobenzyl amine (Aldrich, 0.31 mL, 2.72 mmol) in absolute ethanol (5 mL) was heated to 100 °C for 6 hours. A thick paste formed. The reaction was diluted with water and the solids collected. The crude material was purified by preparative reverse phase HPLC eluting with a gradient of 5 - 95% acetonitrile/water (0.1% TFA). The product precipitated from the column fractions was collected to afford the desired product as a white solid.

^1H NMR (DMSO, 400MHz) δ 12.0 (1H, bs), 10.63, (1H, bs), 8.58 (1H, d, $J = 4.0$ Hz), 7.75 (1H, d, $J = 8.8$ Hz), 7.67 (1H, dd, $J = 4.2, 8.5$ Hz), 7.42 (2H, dd, $J = 5.6, 8.4$ Hz), 7.2 (2H, m), 4.58 (2H, d, $J = 5.7$ Hz) ppm.

HRMS: calc'd for $\text{C}_{16}\text{H}_{12}\text{FN}_3\text{O}_3 + 1\text{H} = 314.0936$, observed 314.0946.

C, H, N calc'd for $\text{C}_{16}\text{H}_{12}\text{FN}_3\text{O}_3$ C=60.99, H=3.90, N=13.34, found C=60.93,

H=3.80, N= 13.02.

EXAMPLE 2

1-{2-[(dimethylamino)sulfonyl]ethyl}-N-(4-fluorobenzyl)-4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamide

Step 1: Preparation of benzyl 2-(chlorosulfonyl)ethylcarbamate

This compound was prepared using the method of T.S. Widlanski and J. Huang, *Tet. Lett.* 1992, 33: 2657. A solution of triphenylphosphine (17.6g, 67.4 mmol) in dry CH_2Cl_2 (90 mL) was cooled to zero degrees C under nitrogen and treated with neat sulfuryl chloride (5.96 mL, 74.2 mmol) to give a yellow solution. The solution was recooled to 5 degrees C and crushed solid sodium 2-
 5 {[(benzyloxy)carbonyl]amino}ethanesulfonate (12g, 42.6 mmol) prepared as described by Bricas et al., *Biochimica et Biophysica Acta* 1955, (18), 358, was added
 10 all at once to give a white suspension. The reaction was allowed to warm to room temperature and stirred for 3 hours. The volatiles were removed in vacuo to give an oily/solid residue that was suspended in EtOAc and added to the top of a silica column (3 inches by 150mm) packed in EtOAc. The product was eluted with EtOAc
 15 and the UV active fractions were combined and evaporated to give the product as a white solid.

^1H NMR (CDCl_3 , 400 MHz) δ 7.35 (5H, bs), 5.20 (1H, bs), 5.12 (2H, bs), 3.89 (2H, bs), 3.85 (2H, bs) ppm.

Step 2: Preparation of benzyl 2-[(dimethylamino)sulfonyl]ethylcarbamate

A solution of dry CHCl_3 (150 mL) in an oven dried flask was tared and gaseous dimethylamine was bubbled into the solution until the gain in tare was 3.4g.

- 5 A dropping funnel was added, the flask was flushed with nitrogen and the solution cooled to 0 °C. Benzyl 2-(chlorosulfonyl)ethylcarbamate (8.8g, 31.6 mmol) in CHCl_3 (20 mL) was added dropwise. The reaction was warmed to room temperature, transferred to a separatory funnel and the solution was washed twice with 10% KHSO_4 solution. The organic layer was dried over Na_2SO_4 , filtered and evaporated
- 10 to give the crude product as an oil that was used as is in the next step.

^1H NMR (CDCl_3 , 400 MHz) δ 7.35 (5H, bs), 5.45 (1H, bs), 5.11 (2H, bs), 3.69 (2H, m), 3.13 (2H, m), 2.86 (6H, s) ppm.

Step 3: Preparation of 2-[(dimethylamino)sulfonyl]ethanaminium chloride

15

- Benzyl 2-[(dimethylamino)sulfonyl]ethylcarbamate (8.8g, 30.7mmol) was suspended/dissolved in 6N HCl (75 mL) and the mixture was heated to 90 °C. The solids dissolved. After 1.5 hours the reaction was cooled and extracted with
- 20 ether. The aqueous layer was evaporated to give a sticky white solid. The ether layer was found to contain unreacted starting material. This was retreated with 6 N HCl at room temperature overnight. The reaction was washed with ether and the aqueous layer combined with the previously isolated product and evaporated to give a white solid.

- 25 ^1H NMR (DMSO-D_6 , 400 MHz) δ 8.2 (2H, bs), 3.43 (2H, m), 3.15 (2H, m), 2.80 (6H, s) ppm.

Step 4: Preparation of 2-[(2-cyanopyridin-3-yl)amino]-N,N-dimethylethanesulfonamide

3-fluoro-2-cyanopyridine (Sakamoto et.al., *Chem. Pharm. Bull.* 1985, 33: 565-571) (1g, 8.2 mmol) was placed in a high pressure tube equipped with a stir bar. DMSO (7 mL), Hunig's base (1.57 mL, 9.0 mmol) and 2-[(dimethylamino)sulfonyl]-ethanaminium chloride (1.7g, 9.0 mmol) were added and the vessel was sealed and heated to 80 °C for 5.5 hours, then stirred at room temperature overnight. The reaction was treated with an additional 0.3 equivalent of Hunig's base and 0.2 equivalent of the amine salt and heated for 3 hours, but the reaction progressed no further. The mixture was cooled, added to the top of a silica gel column (60mm by 7 inches) packed in EtOAc and the column eluted with EtOAc. Careful cutting of fractions allowed isolation of the product after evaporation as a clear, colorless oil that solidified upon standing.

¹H NMR (CDCl₃, 400 MHz) δ 8.05 (1H, dd, *J* = 1.0, 4.4 Hz), 7.34 (1H, dd, *J* = 4.6, 8.6 Hz), 7.10 (1H, d, *J* = 8.6 Hz), 5.20 (1H, bs), 3.75 (2H, dd, *J* = 6.3, 12.6 Hz), 3.2 (2H, m), 2.92 (6H, s) ppm.

Step 5: Preparation methyl 3-({2-[(dimethylamino)sulfonyl]ethyl}amino)-pyridine-2-carboxylate

2-[(2-cyanopyridin-3-yl)amino]-N,N-dimethylethanesulfonamide (1.4g, 5.5 mmol) was dissolved in 50 mL MeOH and placed in a 100 mL pressure flask. The solution was cooled to -78°C and HCl gas was bubbled through the solution until the volume of the solution had noticeably increased. The flask was sealed and the reaction warmed to room temperature and stirred for 4 hours. At this time, LCMS (sampled after re-cooling the reaction to -78°C) showed only a small amount of starting cyano compound remaining. Water (1 mL, 55 mmol) was added and the reaction transferred to a flask equipped with a reflux condenser. The reaction was refluxed for 1.5 hours, stirred at room temperature overnight, then refluxed for 2 more hours, then stirred at room temperature for 48 hours. The solution was evaporated to dryness to give a green /yellow foam that was then partitioned between CHCl_3 and saturated NaHCO_3 . The layers were separated and the aqueous was extracted circa 10 times or until very little UV-active material was removed. The organic layers were dried over Na_2SO_4 , filtered and evaporated to give the product as a clear oil that solidified upon standing.

^1H NMR (CDCl_3 , 400 MHz) δ 8.05 (1H, d, $J = 4.2$ Hz), 7.34 (1H, dd, $J = 4.2$, 8.6 Hz), 7.12 (1H, d, $J = 8.6$ Hz), 3.97 (3H, s), 3.75 (2H, dd, $J = 6.6$, 13.1 Hz), 3.22 (2H, m), 2.90 (6H, s) ppm

Step 6: Preparation of methyl 1-{2-[(dimethylamino)sulfonyl]ethyl}-4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate

Methyl 3-({2-[(dimethylamino)sulfonyl]ethyl}amino)pyridine-2-carboxylate (0.877g, 3.05 mmol) was dissolved in dry THF (10 mL) and cooled to 0°C . NaH (338mg, 60% suspension in oil, 8.45 mmol) was added and a precipitate formed. The slurry was treated with methyl 3-chloro-3-oxopropionate (0.410 mL,

3.82 mmol) and 3 drops of MeOH and allowed to warm and stir overnight. The reaction was concentrated somewhat in vacuo, then poured into water. The mixture was extracted once with CHCl₃, then acidified and extracted repeatedly with CHCl₃ until only a trace of UV active material is removed. The acidic organic extracts were dried over Na₂SO₄, filtered and evaporated to give the product as a pink foam.

¹H NMR (CDCl₃, 400 MHz) δ 8.70 (1H, d, *J* = 3.8 Hz), 7.92 (1H, d, *J* = 8.5 Hz), 7.67 (1H, dd, *J* = 4.2, 8.7 Hz), 4.6 (2H, m), 4.07 (3H, s), 3.34 (2H, m), 2.91 (6H, m) ppm.

- 10 Step 7: Preparation of 1-{2-[(dimethylamino)sulfonyl]ethyl}-N-(4-fluorobenzyl)-4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamide

The mixture was brought to reflux for 2.5 hours, cooled, and the solids collected and washed with a little cold EtOH to give the product as a white solid.

- 20 ¹H NMR (CDCl₃, 400 MHz) δ 10.4 (1H, bs), 8.75 (1H, d, *J* = 4.3 Hz), 7.92 (1H, d, *J* = 8.7 Hz), 7.66 (1H, dd, *J* = 4.2, 8.7 Hz), 7.36 (2H, dd, *J* = 5.4, 8.6 Hz), 7.05 (2H, m), 4.6 (4H, m), 3.28 (2H, m), 2.91 (6H, s) ppm.

Step 1: Preparation of benzyl 2-(methylamino)ethylcarbamate

To a solution of N-methyl ethylene diamine (10g, 135 mmol) in CHCl₃ (100 mL) was added TFA (11.43 mL, 148.4 mmol) and the solution was stirred for several minutes. The reaction was then treated successively with 1-
5 {[(benzyloxy)carbonyl]oxy}pyrrolidine-2,5-dione (Aldrich, 43.7 g, 175.3 mmol) and 18-crown-6 (71.3g, 269.8 mmol). The reaction became slightly green. After stirring for 1 hour at room temperature, TLC (ninhydrin stain) showed no remaining starting amine. The reaction was transferred to a separatory funnel and washed with KOH

The pure fractions were collected and the
15 remaining half of the crude chromatographed in the same way. Product fractions contaminated with some bis-CBZ protected material were dissolved in CHCl₃ and washed with acid water. The aqueous was then basified and extracted with CHCl₃. The organic layer was dried over Na₂SO₄, filtered and concentrated with the other

The column was eluted with a gradient of 20% EtOAc/Hexanes to 100% EtOAc and the clean fractions combined and evaporated to give the product as a yellow oil.

The reaction was concentrated, dissolved in MeOH and adsorbed to silica gel. The product was eluted with CHCl₃ saturated with NH₃, the fractions were collected and evaporated to give the product as a yellow oil that crystallized upon sitting.

A solution of methyl 3-[(2-aminoethyl)amino]pyridine-2-carboxylate (3.9g, 18.6 mmol) in CHCl_3 (25 mL) was treated with pyridine (3 mL, 37.3 mmol) then 1-[[[(benzyloxy)carbonyl]oxy]pyrrolidine-2,5-dione (Aldrich, 5.57 g, 22.3 mmol) for ½ hr. Step 4: Preparation of methyl 1-{2-[[[(benzyloxy)carbonyl](methyl)amino]ethyl]-4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate

In a manner similar to that described for example 2, methyl 3-[[[(benzyloxy)carbonyl]amino]ethyl]amino]pyridine-2-carboxylate was treated with NaH and methyl 3-chloro-3-oxopropionate. After aqueous workup, the resulting oil

Step 5: Preparation of 4-fluoro-2-(methylthio)benzonitrile.

2,4-difluorobenzonitrile (2.0 g, 14.38 mmol) and thiomethoxide (1.02 g, 14.38 mmol) were placed in an oven dried 100 mL round bottom flask fitted with a reflux condenser. Toluene (40 mL) was added and the reaction solution was put under an atmosphere of Argon. The reaction was heated to 90° C over 48 hours. The crude reaction was cooled and concentrated *in vacuo*. The residue was taken up in methylene chloride and extracted with water. The organic phase was dried (MgSO_4), filtered and concentrated to afford a white solid. The solid was dissolved in a minimal amount of methylene chloride and purified on an ISCO column (110 g silica) with a gradient of 100% to 80% hexanes/20% ethylacetate over 15 min at 45 ml/min, then 20% EtOAc/80% Hexanes for 5 min. The collected fractions were evaporated *in vacuo* to afford the desired material in a 7.5:1 ratio 4-fluoro-2-(methylthio)benzonitrile: 2-fluoro-4-(methylthio)benzonitrile. The white solid was carried on to the next step without further purification.

Step 6: Preparation of 4-fluoro-2-(methylsulfonyl)benzonitrile.

4-fluoro-2-(methylthio)benzonitrile (1.59 g, 9.51 mmol, 7.5:1 mixture of regioisomers from Step 1) was dissolved in methylene chloride (50 mL) and 3-chloroperoxybenzoic acid (60% by weight, 4.6 g, 16 mmol) was added. The reaction was put under an atmosphere of Argon and stirred overnight at ambient temperature. The reaction was quenched with saturated aqueous sodium bicarbonate (2 x 100 mL). The organic phase still contained some 3-chloroperoxybenzoic acid by LCMS analysis so 1 mL DMSO was added and stirred for 1 hour. The organic phase was then extracted again with saturated aqueous sodium bicarbonate (100 mL), dried (MgSO₄), filtered and concentrated to afford the desired material as a 7:1 ratio of 4-fluoro-2-(methylsulfonyl)benzonitrile:2-fluoro-4-(methylsulfonyl)-benzonitrile. Selective crystallization from methanol, filtration and drying *in vacuo* afforded the desired 4-fluoro-2-(methylsulfonyl)benzonitrile as white crystals.

4-fluoro-2-(methylsulfonyl)benzonitrile (5.6 g, 28.11 mmol) was added to a dry Parr bottle. Methanol (50 mL) and conc HCl (10 mL) were added and the reaction solution put under an Argon atmosphere. 10% Pd/C (1 gram) was added and the reaction vessel placed on a Parr hydrogenation apparatus. The crude reaction was filtered through celite and concentrated to afford the desired material as a white solid.

EXAMPLE 26

1-Benzyl-N-{4-fluoro-2-[(methylamino)carbonyl]benzyl}-4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamide

5

Step 1: Methyl 2-(bromomethyl)-5-fluorobenzoate

With no precautions to maintain a dry atmosphere, methyl 5-fluoro-2-methylbenzoate (Maybridge, 5g, 29.7 mmole) was dissolved in CCl₄ (50 mL). N-bromosuccinimide (5.82g, 32.7 mmol) and benzoyl peroxide (0.36g, 1.48 mmole) were added and the reaction brought to reflux overnight. An additional 0.3 eq of NBS and 0.01 eq of benzoyl peroxide was added and the reaction refluxed for 4 hrs, then cooled, filtered and concentrated. The residue was chromatographed on silica eluting with a gradient of 0-10% EtOAc/Hexanes. The fractions were collected to give the product, which was a mixture of mono and bis-brominated materials, as a clear oil.

¹H NMR (CDCl₃, 400 MHz, major product peaks) δ 7.67 (1H, dd, *J* = 2.8, 9 Hz), 7.45 (1H, dd, *J* = 5.4, 9 Hz), 7.20 (1H, m), 4.93 (2H, s), 3.95 (3H, s) ppm.

Step 2: Methyl 2-[[bis(*tert*-butoxycarbonyl)amino]methyl]-5-fluorobenzoate

In a dry flask under nitrogen, di-*tert*-butyl iminodicarboxylate (Aldrich, 3.86g, 17.8 mmol) was dissolved in dry DMF (5 mL) and treated with NaH (60% dispersion in oil, 0.71g, 17.8 mmol). After the evolution of gas had ceased, Methyl 2-(bromomethyl)-5-fluorobenzoate (4g, 16.2 mmole) dissolved in DMF (5 mL) was added. An additional 5 mL of DMF was added to aid stirring. The reaction was stirred for 2 hrs, then partitioned between water and EtOAc. The organic layer was dried with Na₂SO₄, filtered and concentrated and the residue was purified on silica eluting first with toluene, then with a gradient of 0-5% MeOH/CHCl₃. The impure product thus obtained was re-chromatographed on silica eluting with a gradient of 0-30% EtOAc/Hexanes. The product was obtained as a clear oil.

¹H NMR (DMSO, 400 MHz,) δ 7.63 (1H, dd, *J*= 2.8, 9.4 Hz), 7.52 (1H, m), 7.20 (1H, dd, *J*= 5.3, 8.7 Hz), 4.98 (2H, s), 3.86 (3H, s), 1.38 (s, 18H) ppm.

Step 3: Preparation of *tert*-butyl 4-fluoro-2-[(methylamino)carbonyl]-benzylcarbamate

A solution of methyl 2-[[bis(*tert*-butoxycarbonyl)amino]methyl]-5-fluorobenzoate (5.0g, 13.04 mmol) in toluene (40 mL) was treated with methyl amine

gas at -78°C until the solution was saturated. The reaction contents were then placed into a steel bomb and heated to 70°C overnight. After cooling, the reaction was concentrated and then the solids were triturated with ether. The resulting solids were collected by vacuum filtration. As a result of the relatively harsh reaction conditions one of the BOC protecting groups was removed from the molecule.

^1H NMR (CDCl_3 , 400 MHz) δ 7.41 (1H, dd, $J = 5.6, 8.3$ Hz), 7.14-7.06 (2H, m), 6.64 (1H, bs), 5.69 (1H, bs), 4.26 (2H, d, $J = 6.3$ Hz), 2.98 (3H, d, $J = 4.8$ Hz), 1.41 (9H, s) ppm.

- 10 Step 4: Preparation of {4-fluoro-2-[(methylamino)carbonyl]phenyl}-methanaminium chloride

- 15 A solution of tert-butyl 4-fluoro-2-[(methylamino)carbonyl]-benzylcarbamate (2.59g, 9.17 mmol) in EtOAc (75 mL) was cooled to -78°C . After cooling solids precipitated out of the solution. HCl gas was added to the suspension until it reached saturation at which time the reaction became homogenous. After adding the HCl gas the dry ice bath was replaced with an ice water bath and the reaction was stirred for 10 minutes at 0°C . The solution was concentrated slowly and then redissolved in EtOAc and this was repeated two more times. The resulting solids were then triturated from EtOAc and fluffy white solids were collected by vacuum filtration.

^1H NMR (DMSO, 400 MHz) δ 8.82 (1H, d, $J = 4.2$ Hz), 8.34 (3H, bs), 7.64 (1H, dd, $J = 5.6, 8.5$ Hz), 7.49-7.41 (2H, m), 4.04 (2H, s), 2.80 (3H, d, $J = 4.5$ Hz) ppm.

25

The above compound ({4-fluoro-2-[(methylamino)carbonyl]phenyl}-methanaminium chloride) may also be prepared in other ways, one of which is the following: 4-fluoro-2-iodo-1-methylbenzene (Maybridge) may be brominated as described for step 1 in the above scheme to give 1-(bromomethyl)-4-fluoro-2-

iodobenzene, and then treated with di-tert-butyl iminodicarboxylate to give di(tert-butyl) 4-fluoro-2-iodobenzylimidodicarbonate. This iodide can then be carbonylated by heating it under pressure with carbon monoxide, dppf, Pd(OAc)₂, an amine base like diisopropylethylamine and a great excess of methylamine in a solvent like DMF to give di(tert-butyl) 4-fluoro-2-[(methylamino)carbonyl]benzylimidodicarbonate containing some mono (tert-butyl) imidodicarbonated material. This mixture can then be treated with HCl gas in a solvent like Ethyl Acetate at cold temperature to remove the (tert-butyl) imidodicarbonate group(s), giving {4-fluoro-2-[(methylamino)-carbonyl]phenyl}methanaminium chloride.

Step 5: Preparation of methyl 4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate (bis sodium salt)

To a solution of methyl 3-[(3-methoxy-3-oxopropanoyl)amino]-pyridine-2-carboxylate (7.3g, 29.9 mmol, prepared as described in example 1) in anhydrous THF (100 mL) was added solid sodium methoxide (3.9g, 72.4 mmol) at 0°C. Immediately following the addition of the sodium methoxide, solids crashed out of the solution. The ice bath was then removed and the suspension was stirred for an additional 0.5 hours. The suspension was then filtered through a medium porosity filtration funnel to afford yellow solids.

¹NMR (D₂O, 400 MHz) δ 8.17 (1H, d, *J* = 4.4 Hz), 7.38 (1H, d, *J* = 8.4 Hz), 7.26 (1H, dd, *J* = 4.4, 8.4 Hz), 3.72 (3H, s) ppm.

Step 6: Preparation of methyl 1-benzyl-4-(benzyloxy)-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate

To a solution of the sodium salt of methyl 4-hydroxy-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate (2.0g, 7.57 mmol) in water (50 mL) was added a solution of benzyl bromide (3.89g, 22.72 mmol) in methylene chloride (50 mL). To the biphasic solution was then added tetrabutylammonium bromide (1.2g, 3.79 mmol) and the reaction was sealed and heated to 50°C. After stirring overnight the reactions was cooled and the two layers were separated. The aqueous layer was extracted one time with methylene chloride and the combined organics were dried over sodium sulfate, filtered and concentrated. The crude mixture was separated by normal phase chromatography using an Isco 120 gram silica gel cartridge with a 50 minute gradient running at 40 mL/min. of 10% to 60% EtOAc/hexanes. The tubes containing the desired product were concentrated and taken on to the next step.

¹NMR (CDCl₃, 400 MHz) δ 8.55 (1H, m), 7.59 (1H, d, *J* = 8.7 Hz), 7.48 (2H, d, *J* = 7.3 Hz), 7.37-7.16 (9H, m), 5.69 (2H, s), 5.46 (2H, s), 3.87 (3H, s) ppm.

Step 7: Preparation of 1-benzyl-4-(benzyloxy)-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylic acid

To a solution of methyl 1-benzyl-4-(benzyloxy)-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylate (0.65g, 1.62 mmol) in THF (20mL) was added sodium hydroxide (16.2 mL, 1 N) and the solution was heated to 80°C and after 1.5 hours the reaction was completed. The reaction was allowed to cool and then the THF was removed leaving the product in water. The water was acidified with 1N HCl to adjust the pH to 3 and the resulting crude solids were collected by vacuum filtration and taken on as is.

Step 8: Preparation of 1-benzyl-4-(benzyloxy)-N-{4-fluoro-2-[(methylamino)carbonyl]benzyl}-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamide

To a solution of 1-benzyl-4-(benzyloxy)-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxylic acid (0.15g, 0.39 mmol) in DMF (4 mL) was added HOAT (0.26g, 1.94 mmol) and EDC (0.07g, 0.47 mmol). The solution was stirred for 10 minutes at which time EDC (0.036g, 0.23 mmol), {4-fluoro-2-
5 [(methylamino)carbonyl]phenyl}methanaminium chloride (0.108g, 0.47 mmol), and DIEA (0.10g, 0.78 mmol) were added. The reaction was then stirred at room temperature overnight at which time the solution was purified by preparative reverse phase HPLC eluting with a gradient of 5 - 95% acetonitrile/water (0.1% TFA). The fractions that contained the desired product were concentrated. Note that during the
10 prep des-O-benzyl product was also obtained. The mixture was taken on to the next step.

Step 9: Preparation of sodium 1-benzyl-3-[(4-fluoro-2-
20 [(methylamino)carbonyl]benzyl)amino)carbonyl]-2-oxo-1,2-dihydro-1,5-naphthyridin-4-olate

To a solution of 1-benzyl-4-(benzyloxy)-N-{4-fluoro-2[(methylamino)carbonyl]benzyl}-2-oxo-1,2-dihydro-1,5-naphthyridine-3-carboxamide (0.06g, 0.11 mmol) in methylene chloride (3 mL) was added TFA (1
25 mL) The reaction was stirred for 5 minutes at room temperature and then concentrated. The residue was redissolved in a minimum of DMF and purified by preparative reverse phase HPLC eluting with a gradient of 5 - 95% acetonitrile/water (0.1% TFA). The fractions that contained the desired product were concentrated. The solids were dissolved in a 50:50 mixture of CH₃CN/acetone followed by the
30 addition of 1 N NaOH (0.109 mL). The solution was stirred for 0.5 hours and then concentrated to afford yellow solids.

¹NMR (DMSO, 400 MHz) δ 11.20 (1H, d, *J* = 5.5 Hz), 8.68 (1H, d, *J* = 4.2 Hz), 8.28 (1H, d, *J* = 5.8 Hz), 7.51-7.47 (2H, m), 7.23 (1H, dd, *J* = 4.2, 8.4 Hz), 7.29-7.16 (7H, m), 5.38 (2H, bs), 4.53 (2H, d, *J* = 5.8 Hz), 2.78 (3H, d, *J* = 4.4 Hz) ppm.

HIV Integrase Assay: Strand Transfer Catalyzed by Recombinant Integrase

Assays for the strand transfer activity of integrase were conducted in accordance with the method described in Example 193 of WO 02/30930 for recombina
5 nt integrase. Representative compounds of the present invention exhibit inhibition of strand transfer activity in this assay. For example, the compounds prepared in Examples 1-27 were tested in the integrase assay and all were found to have IC₅₀'s less than 0.5 micromolar.

Further description on conducting the assay using preassembled
10 complexes is found in Wolfe, A.L. et al., *J. Virol.* 1996, 70: 1424-1432, Hazuda et al., *J. Virol.* 1997, 71: 7005-7011; Hazuda et al., *Drug Design and Discovery* 1997, 15: 17-24; and Hazuda et al., *Science* 2000, 287: 646-650.
